

Palermo

ARCUS PROFESSIONAL / ONE-PAGE TERRITORY BRIEFING

The selected province requires preliminary screening for Bridge interventions. The value is not the case list: it is understanding whether Palermo has already shown concentrated vulnerability under extreme conditions or risk distributed over time.

DECISION MESSAGE

Distributed chronic risk

historical risk distributed across multiple events and dates (33% on the most recurrent date). The 41.06x rate versus the national average places Palermo among the provinces with documented historical vulnerability above the ARCUS/AINOP benchmark. Palermo is national rank 5 by documented ARCUS/AINOP collapse rate.

01 NEXT ACTIONS

- Use the territorial exposure indicators to identify the dominant territorial signal.
- Read the documented distributed historical pattern and use individual cases as map/appendix references.
- Request the minimum technical data package for the dominant structural signal before site-specific design assumptions.
- Commission site-specific checks calibrated to the dominant structural context and local geomorphology.

DATA REQUEST PACKAGE

Local hazard study; asset geometry and foundations; inspection history; source-backed site constraints.

CONFIDENCE NOTE

Collapse Rate confidence: very low. The AINOP denominator should be read as available bridge-census coverage, not as a perfect inventory of the bridge stock.
