

Territory Briefing: Torino

Province-level professional screening for Bridge, built on ARCUS' Italian bridge-collapse evidence base. Full analytical detail remains in the full report and exports.

REPORT ID
ARCUS-P01-
20260609-torino

CONTEXT
Bridge

DRIVER
Hydraulic

DATE
09/06/2026

01 ARCUS Cases Map

Static ARCUS cases map. Full interactive view available in Professional Atlas.

02 Executive Signal

Hydraulic / Bridge

Province-level Hydraulic signal. Use it to frame Bridge checks; confirm with site-specific data. ARCUS translates documented collapse history into operational next checks.

FINAL PRIORITY INDEX
87

COLLAPSE RATE
5.82x

CONFIDENCE
high

HISTORICAL EVENTS
42

Hydraulic exposure		97
Structural Vulnerability Exposure		30
Landslide exposure		28
Seismic exposure		28

3 KEY FINDINGS

Why It Matters

The decision message is the historical pattern: Concentrated flood scenario. Individual cases remain in the full PDF, map and exports. Note: the cases selected for map/appendix refer to the same 13-16 October 2000 flood event in Piemonte and Valle d'Aosta. This should be read as documented extreme-flood vulnerability, not independent recurrent events.

- Asset: first systematic database of collapsed bridges in Italy from 2000 to today.
- Pattern: Concentrated flood scenario; collapses concentrated in a single flood/extreme-hydraulic scenario (2000-10-13, 88%).
- Collapse Rate: 5.82x national ARCUS/AINOP rate. This places Torino among the provinces with the highest documented collapse rate in Italy (national rank 12).
- Action: run site-specific checks before design decisions.

CHECKS

What To Check

- Translate the province signal into site-specific checks.
- Evaluate the concentrated/distributed historical scenario before defining checks.
- Check Hydraulic assumptions on site.
- Use WMS overlays as screening context only.
- Document limits before design decisions.

DATA TO REQUEST

Before Decisions

- Hydraulic model or preliminary hydraulic study
- Riverbed survey / bathymetry where relevant
- Geotechnical investigation and foundation concept
- Historical flood levels
- Inspection accessibility constraints

Province-level screening only, not design scale. ARCUS does not certify structural safety or asset condition. Collapse Rate confidence: high. AINOP denominator is broad enough for provincial relative benchmarking.
