

PATH 01 - NEW TERRITORY

Territory Briefing: Torino

Professional province-level preliminary briefing: historical evidence, Atlas map, project-context focus and operational next checks.

INFRASTRUCTURE INTELLIGENCE / GENERATED 04/06/2026

ANALYSIS

**Territory
Briefing**

**SPATIAL
LEVEL**

**Province
level**

**GENERATED
BY**

**ARCUS
Professional**

ARCUS identifies 42 documented cases in the selected province and translates the Step 3 exposure indicators into operational actions for Bridge interventions. The PDF map shows ARCUS cases; the hazard-layer contribution is summarised through the indicators below. The dominant territorial signal is **Hydraulic**; the leading historical driver is **Hydraulic**.

Recommended use: province-level preliminary screening for Bridge interventions, before design, due diligence or site-specific investigation.

FINDING 1

The hydraulic context dominates the territorial reading.

FINDING 2

41 triggered events and 30 total collapses shape the technical priority.

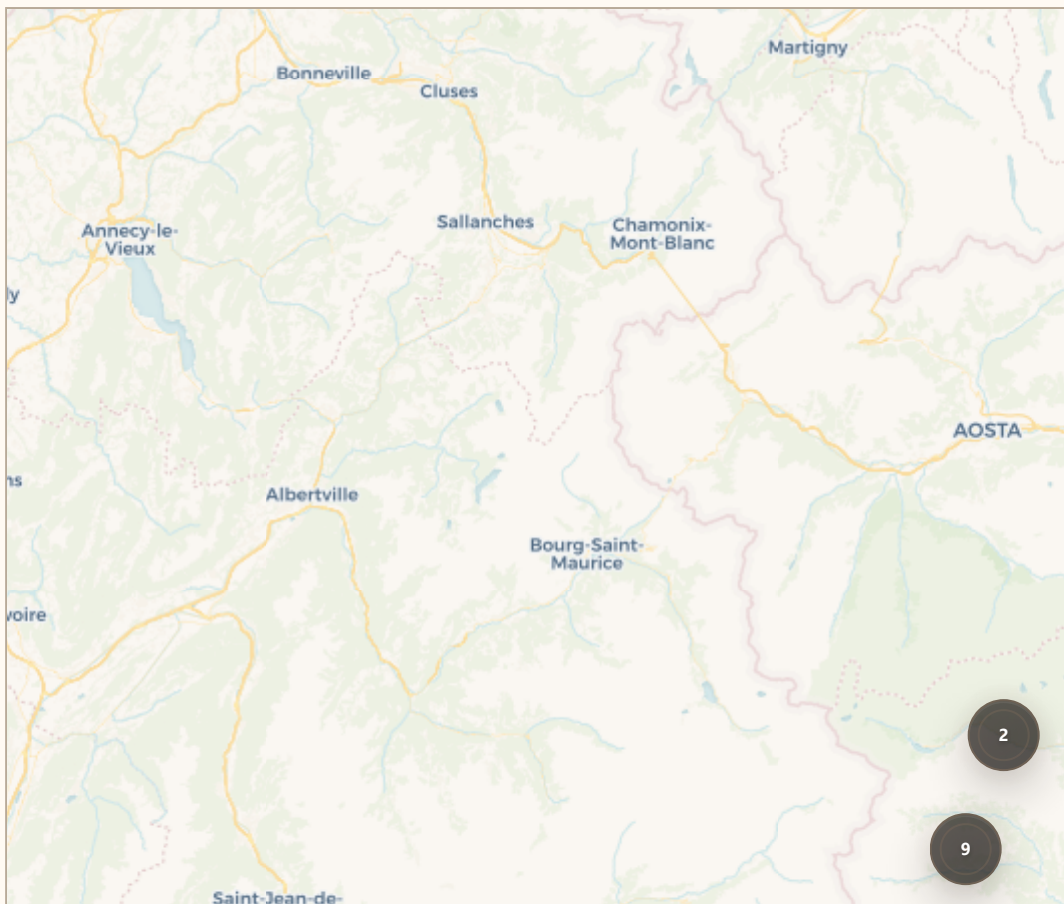

FINDING 3

Very high evidence reliability with 125 linked sources.

WHY ARCUS FLAGS THIS

- Dominant exposure: Hydraulic (97 / 100).
- Historical severity: 30 total collapses and 41 triggered events.
- Map-linked cases: P1 Castellamonte, P2 Ala di Stura, P3 Ala di Stura.
- Evidence package: 125 linked sources supporting the signal.

02 SELECTED PROVINCE & ARCUS CASES MAP

Map extracted from ARCUS Professional Atlas. The PDF map shows the ARCUS georeferenced cases within the selected province. Public hazard overlays are not visually stacked in the PDF map to preserve readability. Their contribution is summarised through the exposure indicators and the Hazard / Exposure Context section below. For full interactive exploration of Hydraulic, Landslide and Seismic layers, users can open ARCUS Professional Atlas.

Map extracted from ARCUS Professional Atlas. The PDF map shows the ARCUS georeferenced cases within the selected province. Public hazard overlays are not visually stacked in the PDF map to preserve readability. Their contribution is summarised through the exposure indicators and the Hazard / Exposure Context section below. For full interactive exploration of Hydraulic, Landslide and Seismic layers, users can open ARCUS Professional Atlas.

03 HOW TO READ THIS REPORT

ARCUS starts from the selected province, reads all records available for that administrative area, identifies the dominant territorial pattern and turns that signal into operational next checks. This is province-level screening, not structural safety certification.

SELECTED PROJECT CONTEXT

Bridge

ARCUS reading: for Bridge interventions, the Hydraulic signal does not define a design solution. It identifies the technical attention fields that should be checked before design, due diligence or site-specific investigation decisions in the province of Torino.

DRIVER

Hydraulic / 97

The selected province is mainly driven by hydraulic exposure: 41 matched collapses out of 42 analysed events (98%). Other layers should be read as secondary preliminary-screening context.

04 KEY INDICATORS

PRIORITY INDEX

82 / 100

HIGH ATTENTION

Hydraulic

EVIDENCE RELIABILITY

96 / 100

VERY HIGH

125 linked sources

FAILURE PRECEDENT EXPOSURE

72 / 100

HIGH

Hydraulic

HISTORICAL EVENTS

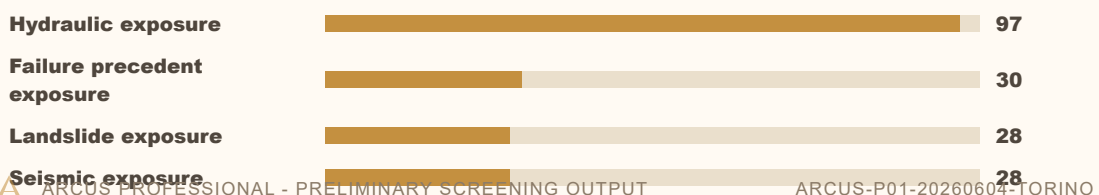

42

98% HYDRAULIC

41 triggered events

05 HAZARD / EXPOSURE CONTEXT

The Step 3 analysis combines public Hydraulic, Landslide and Seismic layers with ARCUS historical cases. For PDF readability, the map displays ARCUS cases only. The influence of the active hazard layers is represented through the exposure scores below.

06 OPERATIONAL MEANING

PRIMARY FOCUS

Preliminary hydraulic compatibility; Scour susceptibility; Foundation, pier and abutment exposure

ARCUS reading: for Bridge interventions, the Hydraulic signal does not define a design solution. It identifies the technical attention fields that should be checked before design, due diligence or site-specific investigation decisions in the province of Torino.

ATTENTION POINTS

- Preliminary hydraulic compatibility
- Scour susceptibility
- Foundation, pier and abutment exposure
- Riverbed dynamics and sediment/debris transport
- Flood/debris scenarios and inspection accessibility

07 PRIORITY ARCUS CASES

The selected province contains all ARCUS records available for that administrative area. This section highlights the highest-priority cases within the provincial set, ranked by severity, trigger, dominant driver and evidence reliability. These cases are not external comparables: they explain the dominant territorial signal used by the report.

P1 B00.10.15 - Castellamonte 2000-10-13 / Hydraulic

Total Collapse / A

P2 B00.10.03 - Ala di Stura 2000-10-13 / Hydraulic

Total Collapse / A

P3 B00.10.05 - Ala di Stura 2000-10-13 / Hydraulic

Total Collapse / A

08 TERRITORIAL PATTERN INTERPRETATION

The selected province shows a concentrated Hydraulic pattern. This pattern supports preliminary attention toward preliminary hydraulic compatibility, scour susceptibility, foundation, pier and abutment exposure, riverbed dynamics and sediment/debris transport for Bridge interventions.

09 INTERPRETATION

For new Bridge interventions, ARCUS directs first checks toward Hydraulic. The reading is derived from provincial ARCUS cases, hazard overlays and evidence quality: it does not automatically indicate structural criticality, but defines what should be checked next.

10 IMMEDIATE SCREENING ACTIONS

ACTION 1

Use the Step 3 exposure indicators to identify the dominant Hydraulic signal.

ACTION 2

Review P1-P3 Priority ARCUS Cases.

ACTION 3

Request the minimum technical data package.

ACTION 4

Commission site-specific hydraulic and geotechnical checks.

11 DATA TO REQUEST BEFORE DESIGN DECISIONS

DATA 1

Hydraulic model or preliminary hydraulic study

DATA 2

Riverbed survey / bathymetry where relevant

DATA 3

Geotechnical investigation and foundation concept

DATA 4

Historical flood levels

DATA 5

Inspection accessibility constraints

12 RECOMMENDED CLIENT PATH

1. Use the Step 3 exposure indicators to identify the dominant Hydraulic signal.
2. Review P1-P3 Priority ARCUS Cases.
3. Request the minimum technical data package.
4. Commission site-specific hydraulic and geotechnical checks.
5. Use CSV and GeoJSON exports for technical coordination.

13 NATIONAL BENCHMARK

Compared with the national ARCUS baseline, the selected province is above average for Triggered-event share, Professional-grade sources, Failure precedent exposure. If triggered-event share is above average, the briefing should be used to anticipate hydraulic, geotechnical and territorial-context checks before site-specific design.

14 DATA COVERAGE & LIMITATIONS

Province-level screening: not design scale.

ARCUS does not certify structural safety or asset condition.

Public overlays guide priorities and must be followed by site-specific checks.

A SOURCE APPENDIX

Main sources linked to events in the selected province, deduplicated by title or URL. Total linked sources in this briefing: 125. The full source table can be exported separately from ARCUS Professional.

15 METHODOLOGY SNAPSHOT

ARCUS combines historical collapse evidence, source reliability, spatial relevance, severity, triggers, cause similarity, territorial hazard context and public WMS overlays. The briefing supports preliminary screening and prioritisation: it is not a structural safety certification.

COMPONENT	USE IN THE BRIEFING
Historical evidence	Documented ARCUS records, causes, triggers and severity.
Source reliability	Number, role and quality of available sources.
Spatial relevance	Selected province and administrative provincial boundary.
Hazard context	Public hydraulic/landslide WMS overlays and seismic context.
Priority ARCUS cases	Cases inside the selected province, ranked by severity, trigger, dominant driver and evidence reliability.

16 SCORE AND CLASS LEGEND

CLASS	INTERPRETATION
A	High reliability: multiple sources, preferably institutional or technical.
B	Medium reliability: documented event with limited coverage or source variety.
C	Limited reliability: local, incomplete or to-be-strengthened evidence.
Critical	Maximum attention: strong historical and/or territorial evidence.
High	High attention: significant evidence but not necessarily complete.
Medium / Low	Moderate or low attention, to be read together with available data.
