01 ARCUS Cases Map

The map shows ARCUS cases within the selected province. Hazard overlays are summarised through exposure indicators. Full layer control is available in ARCUS Professional Atlas.

02 Executive Signal

Hydraulic / Bridge

Province-level Hydraulic signal. Use it to frame Bridge checks; confirm with site-specific data. Use this brief to decide which checks and data requests should come next.

Hydraulic exposure	97
Historical Failure Context	30
Landslide exposure	28
Seismic exposure	28

3 KEY FINDINGS

Why It Matters

P1-P3 are the highest-priority ARCUS cases within the selected province and help explain the dominant territorial signal.

- Signal: Hydraulic 97 / 100.
- Map refs: P1 Castellamonte, P2 Ala di Stura, P3 Ala di Stura.
- Action: run site-specific checks before design decisions.

CHECKS

What To Check

1. Translate the province signal into site-specific checks.
2. Review P1-P3 priority ARCUS cases.
3. Check Hydraulic assumptions on site.
4. Use WMS overlays as screening context only.
5. Document limits before design decisions.

DATA TO REQUEST

Before Decisions

- Hydraulic model or preliminary hydraulic study
- Riverbed survey / bathymetry where relevant
- Geotechnical investigation and foundation concept
- Historical flood levels
- Inspection accessibility constraints

Province-level screening only, not design scale. ARCUS does not certify structural safety or asset condition. CSV and GeoJSON remain the detailed data package.
