

Territory Briefing: Torino

Province-level professional screening for bridge. Executive decision sheet; full analytical detail remains in the full report and exports.

REPORT ID
ARCUS-P01-
20260603-torino

CONTEXT
bridge

DRIVER
hydraulic

DATE
03/06/2026

01 Real Atlas Map

02 Executive Signal

hydraulic / bridge

For a bridge project context, the dominant driver (Hydraulic) is translated into preliminary attention points. This section does not prescribe design solutions: it frames checks, data requests and comparison with precedents in the province of Torino.

PRIORITY INDEX
82

EVIDENCE
125

EVENTS
42

EXPOSURE
97

Hydraulic exposure	97
Failure precedent exposure	30
Landslide exposure	28
Seismic exposure	28

3 KEY FINDINGS

Why it matters

- hydraulic is the dominant Step 3 signal (97 / 100).
- P1 Castellamonte, P2 Ala di Stura, P3 Ala di Stura are the map-referenced priority precedents.
- bridge changes the operational reading: Preliminary hydraulic compatibility; Scour susceptibility.

5 NEXT CHECKS

What to do next

- For new bridge interventions in the province of Torino, prioritise preliminary hydraulic compatibility checks, including flood levels, flow concentration, debris transport and riverbed evolution.
- Treat scour susceptibility as a primary design-screening topic where foundations, abutments or piers interact with active watercourses.
- Compare the planned intervention with documented hydraulic or total-collapse precedents in Castellamonte, Ala di Stura, Felleto, Balme, Chialamberto before defining investigation priorities.
- Use public WMS layers and ARCUS historical precedents as first-level screening, then commission site-specific hydraulic, geotechnical and structural checks before design decisions.
- Where historical precedent density is high, include inspection accessibility and monitoring feasibility in early design discussion.

LIMITATIONS

Use correctly

- Province-level screening only, not design scale.
- ARCUS does not certify structural safety or asset condition.
- CSV and GeoJSON remain the detailed data package.

TOP DATA TO REQUEST

- Hydraulic model or preliminary hydraulic study
- Riverbed survey / bathymetry where relevant
- Geotechnical investigation and foundation concept
