

Territory Briefing: Torino

Province-level professional screening for bridge. Generated as an executive decision sheet; full analytical detail is provided in the full PDF and exports.

REPORT ID
ARCUS-P01-
20260603-torino

**PROJECT
CONTEXT**
Bridge

**DOMINANT
DRIVER**
Hydraulic
exposure

- HYDRAULIC OVERLAY
- LANDSLIDE OVERLAY
- SEISMIC CONTEXT

02 Executive Signal Hydraulic exposure / Bridge

For bridge interventions in the selected province, ARCUS indicates that preliminary attention should focus on hydraulic compatibility and related checks because the dominant indicator is hydraulic exposure. This is a province-level screening signal and must be translated into site-specific checks by qualified professionals.

EXPOSURE SCORE

97

Hydraulic exposure	97
Landslide exposure	28
Seismic exposure	28
Structural / failure precedent exposure	30

3 KEY FINDINGS

Why it matters

- Hydraulic exposure is the dominant Step 3 exposure signal (97 / 100).
- P1 Castellamonte, P2 Ala di Stura, P3 Ala di Stura are the map-referenced priority precedents.
- Bridge changes the operational reading: Hydraulic compatibility; scour susceptibility; foundation, pier and abutment exposure.

5 NEXT CHECKS

What to do next

- Verify whether the planned crossing interacts with active riverbeds or flood-prone corridors.
- Review hydraulic-triggered total-collapse precedents in the selected province.
- Prioritise hydraulic modelling and scour screening before preliminary design consolidation.
- Check foundation, pier and abutment exposure to riverbed evolution and debris accumulation.
- Translate province-level screening into site-specific checks by qualified professionals.

LIMITATIONS

Use correctly

- Province-level screening only, not design scale.
- ARCUS does not certify structural safety or asset condition.
- CSV and GeoJSON exports remain the detailed data package.

TOP DATA TO REQUEST

- Hydraulic model or preliminary hydraulic study
- Riverbed survey / bathymetry where relevant
- Historical flood levels
